Gaming Industry

$120 BILLION

The Gaming Industry is a multibillion dollar market that's constantly growing year after year. Blockchain Gaming soaring success still has enormous room for growth, achievable both by tapping into the traditional market and by revolutionizing it through its decentralize approach.
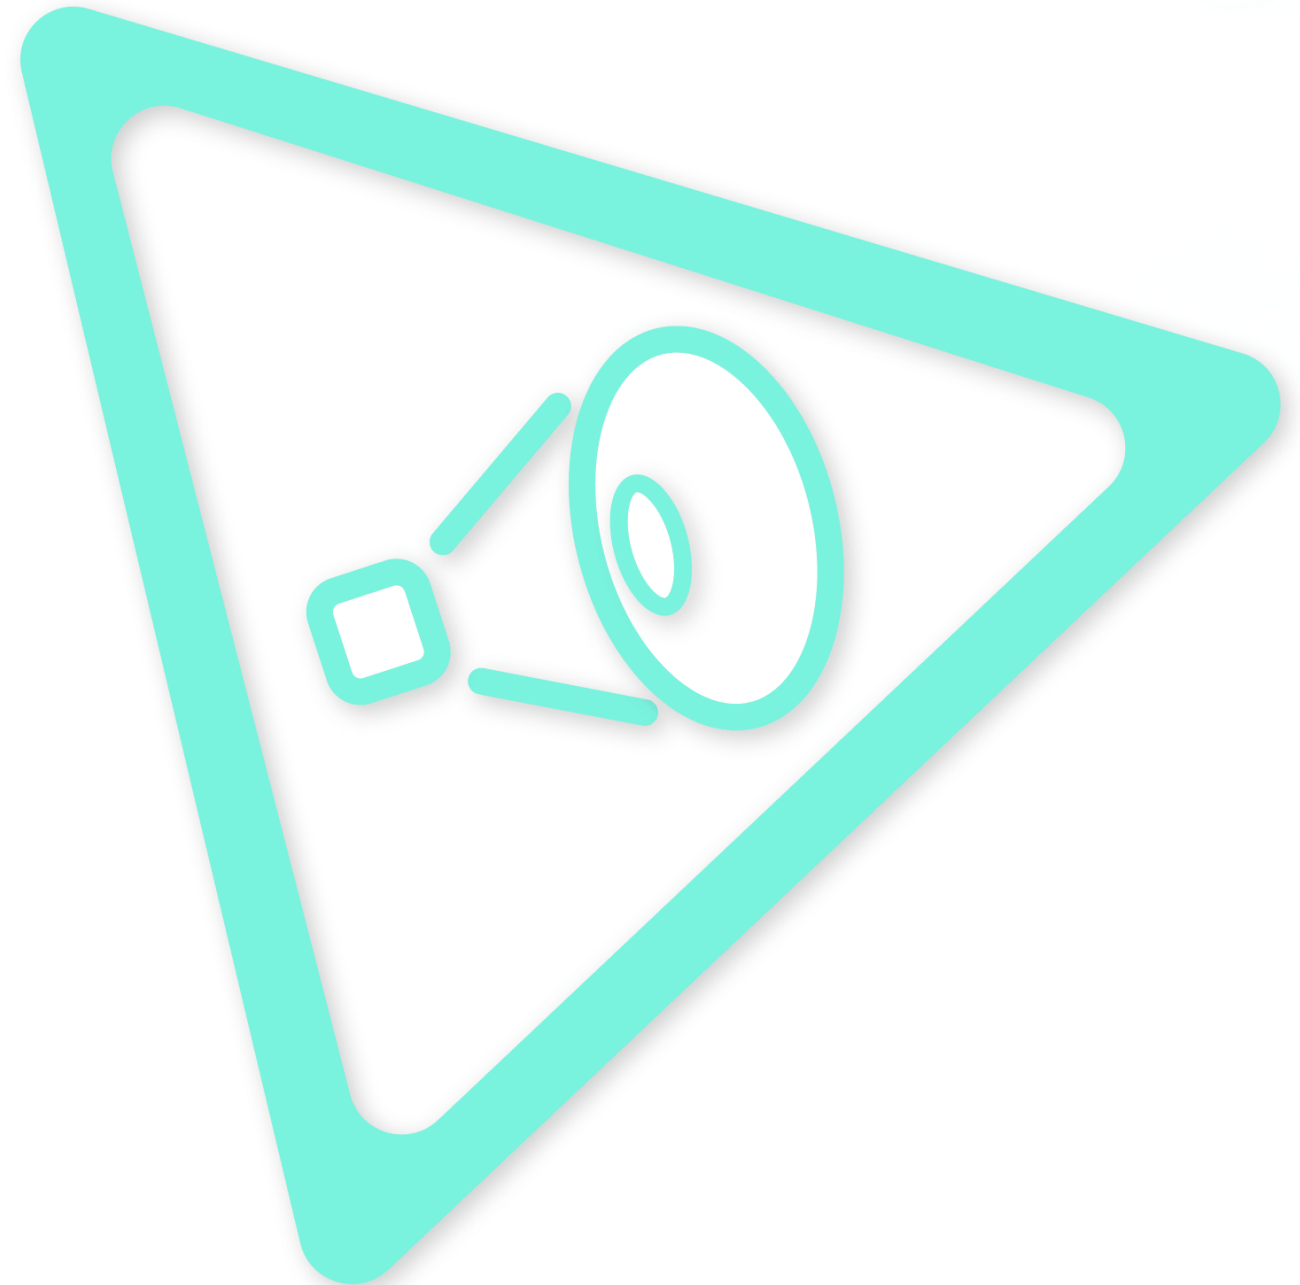

What is VisionGame?

VisionGame helps gaming companies develop the industry standards of tomorrow through a suite of tools that ease up evelopment, simplifies users onboarding, and connects studios and gamers through a next-gen Crowdfunding portal.

Our goal is to showcase the blockchain capabilities, attracting traditional companies and helping blockchain ones paving the way to the future of gaming.
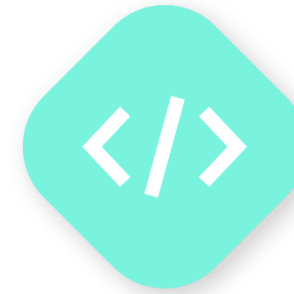

SIMPLIFIED DEVELOPMENT
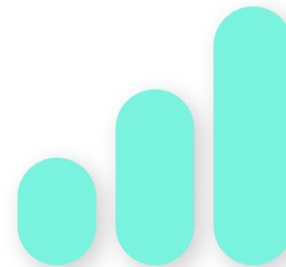

GROWTH ACCELERATOR

CROWDFUNDING PLATFORM

Hurdles Stumping the Industry's Growth

DEVELOPERS

Implementing essential blockchain's features often requires dedicated resources that could be better used doing what game developers do best: create amazing experiences for games.

GAMERS

Blockchain Gaming onboarding is overly complicated, scaring away traditional gamers and often requiring substantial initial investments to gain the necessary NFTs to play.

FUNDRAISING

Companies are turning to crowdfunding to connect with their audiences and raise funds in the process. The available platforms fail to be flexible enough for offer to meet demand.
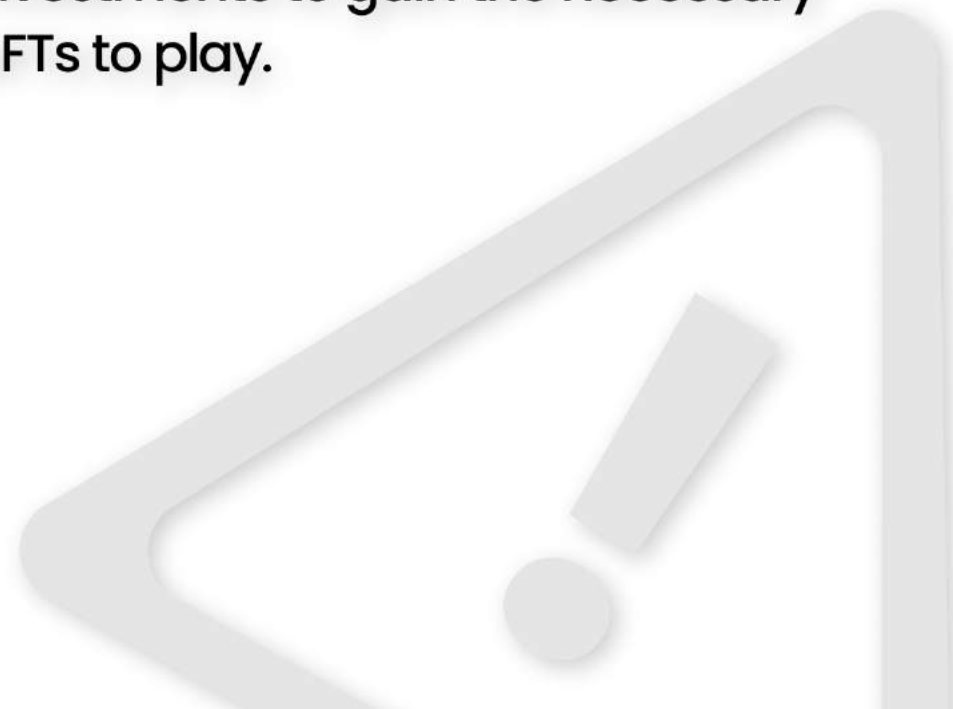

VisionGame has the Solution

DEVELOPERS

Through a state-of-the-art SDK and an intuitive interface, implementing NFTs and other essential blockchain's feature will be easier than ever, letting developers focus on their craft.

GAMERS

A revolutionary wallet and a single sign-on process allows gamers to dive right into the action wether they're familiar with blockchain concepts or not.

FUNDRAISING

Our Next-Gen crowdfunding platform lets fans support the projects they love without forcing companies to plan in-game items (NFTs) at the early stages of development.

VisionSDK: Blockchain Made Easy

As Blockchain features disrupt the traitional space creating new markets and possibilities, gaming companies often lack the necessary resources and know-how to implement in their products.

At the core of our solution for this problem, stands VisionSDK. Through a mix of centralized and decentralized architecture, our SDK allows developers to keep the focus on their craft while we do the rest.

The VisionSDK works at the Application Layer, connecting our services and blockchain solution into a seamless experience for both developers and users. Through a simplified interface, developers are able to create NFTs and integrate them into their projects in a matter of minutes.

For Game Developers, by Game Developers

VisionSDK doesn't focus solely on blockchain related features. General Game Development can also benefit greatly from it, introducing the features developers are familiar with, simplified through a strong middle layer.

Realtime Multiplayer through an industry standard solution will allow companies to create amazing competitive or collaborative experiences without needing any additional know-how.

User registration and database handling, turn-based multiplayer, realtime chat are only a few of the traditional features VisionSDK will offer, alongside its blockchain related solutions.

Vision.Game
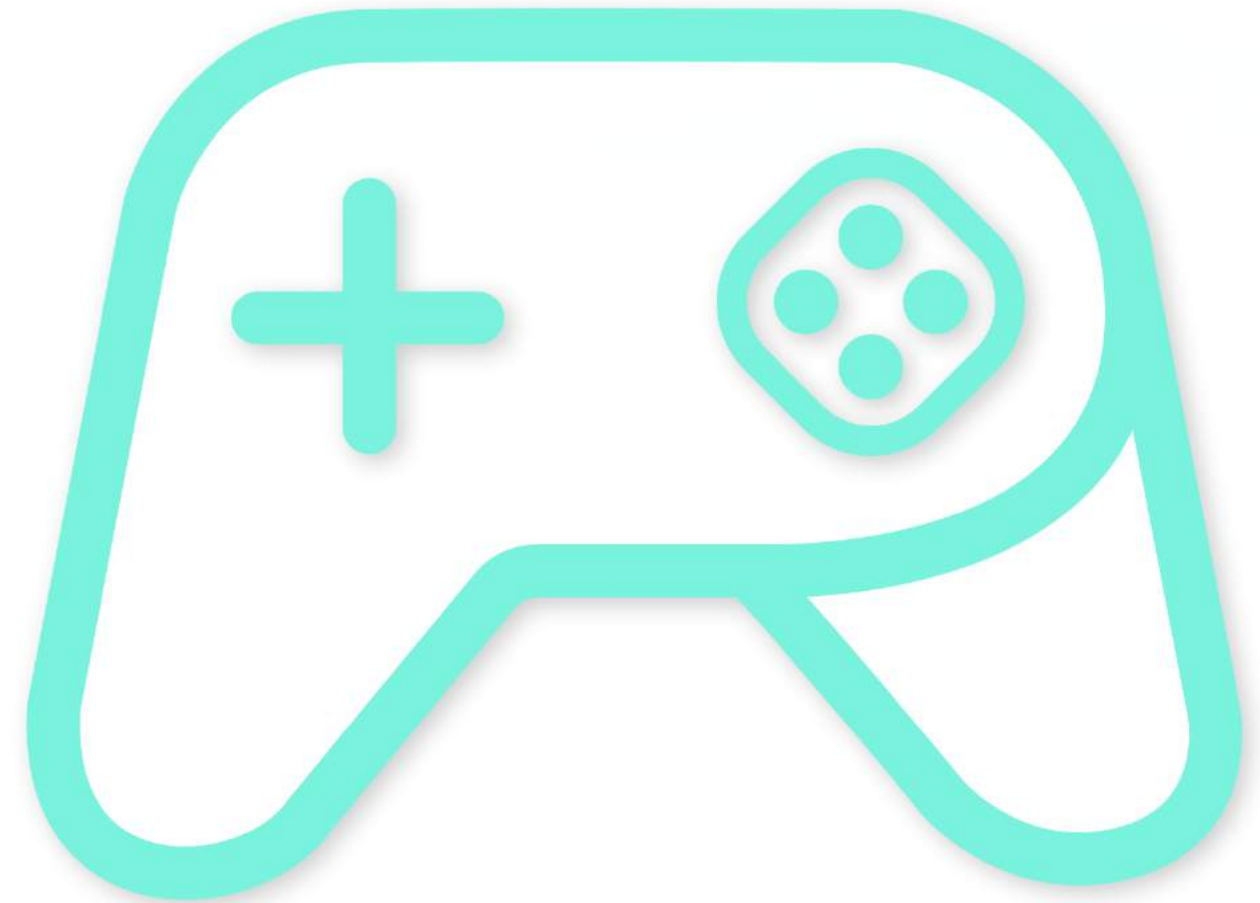

Starting with Solana, a Multiple Blockchains Approach

VisionSDK aims to empower, not to limit. Towards that goal, our multichain approach will allow developers to scale their game on the solution they prefer. Starting with Solana, fast and reliable, our SDK will suppor the popular chains of today and tomorrow.

Terra
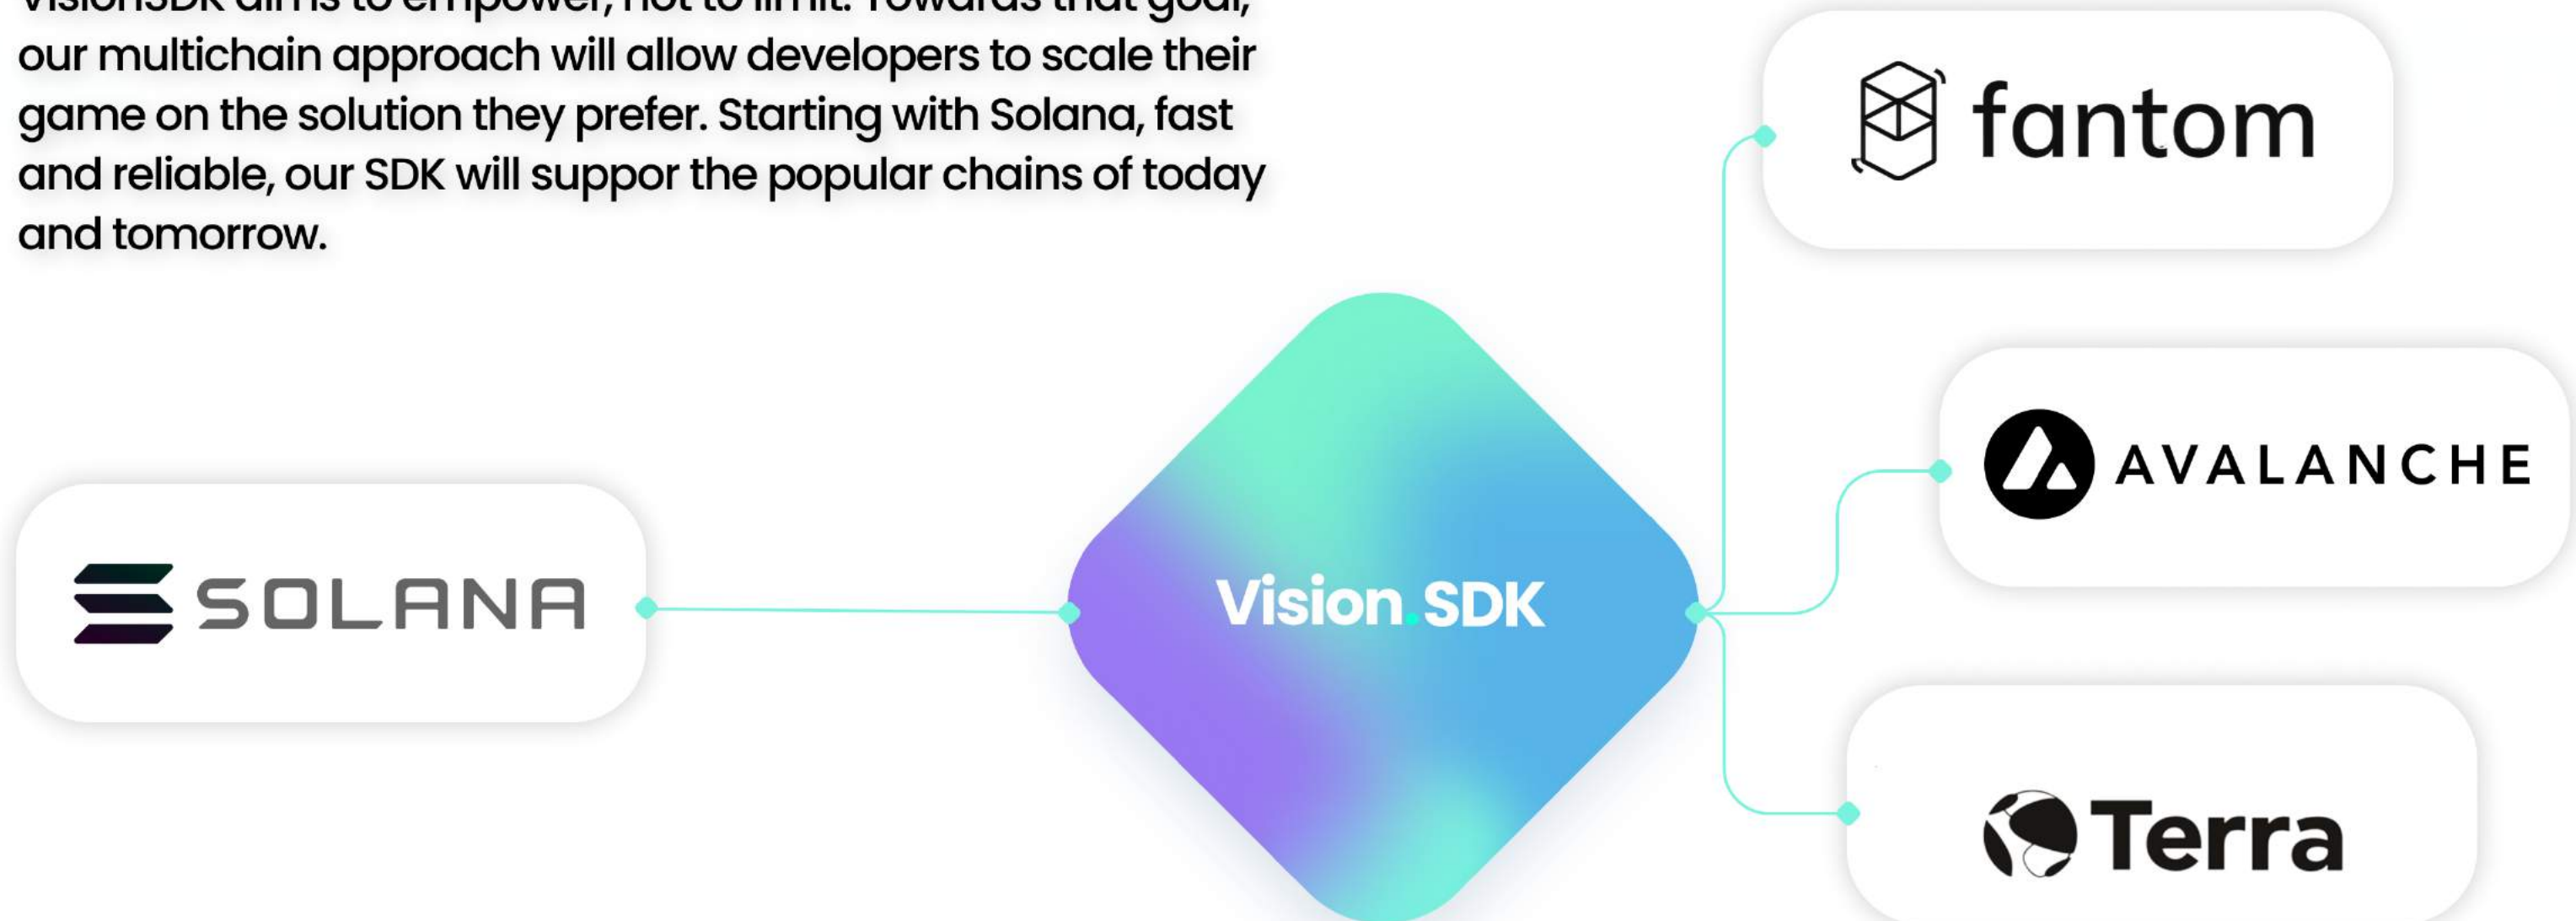

DIY Blockchain is not the answer

VisionSDK provides all the features developers need to support their blockchain solution right out of the box. No technical know-how is required, leaving resources intact to focus on what really matters: the game experience.

Through an easy to use interface, NFTs implementation, users handling and multichain support turn into tasks of days rather than months, allowing companies to reach the market faster and better than ever before.

Technical Architecture

The VisionSDK simplifies blockchain integration for the developers and provides an easier onboarding process for users. The single sign-on process doesn't only ensure that users will be able to easily and quickly try out new games after their first registration, but it also provides developers with an aggregated userbase ready to jump into their game.

Our decentralized core layer powered by Enjin allows our users secure and reliable access to their NFTs, guaranteeing a floor value to every in-game item they own.

Global registration guarantees a faster onboarding

Offchain User Information

Highly scalable and guarantees a floor value to all NFTs

Engine
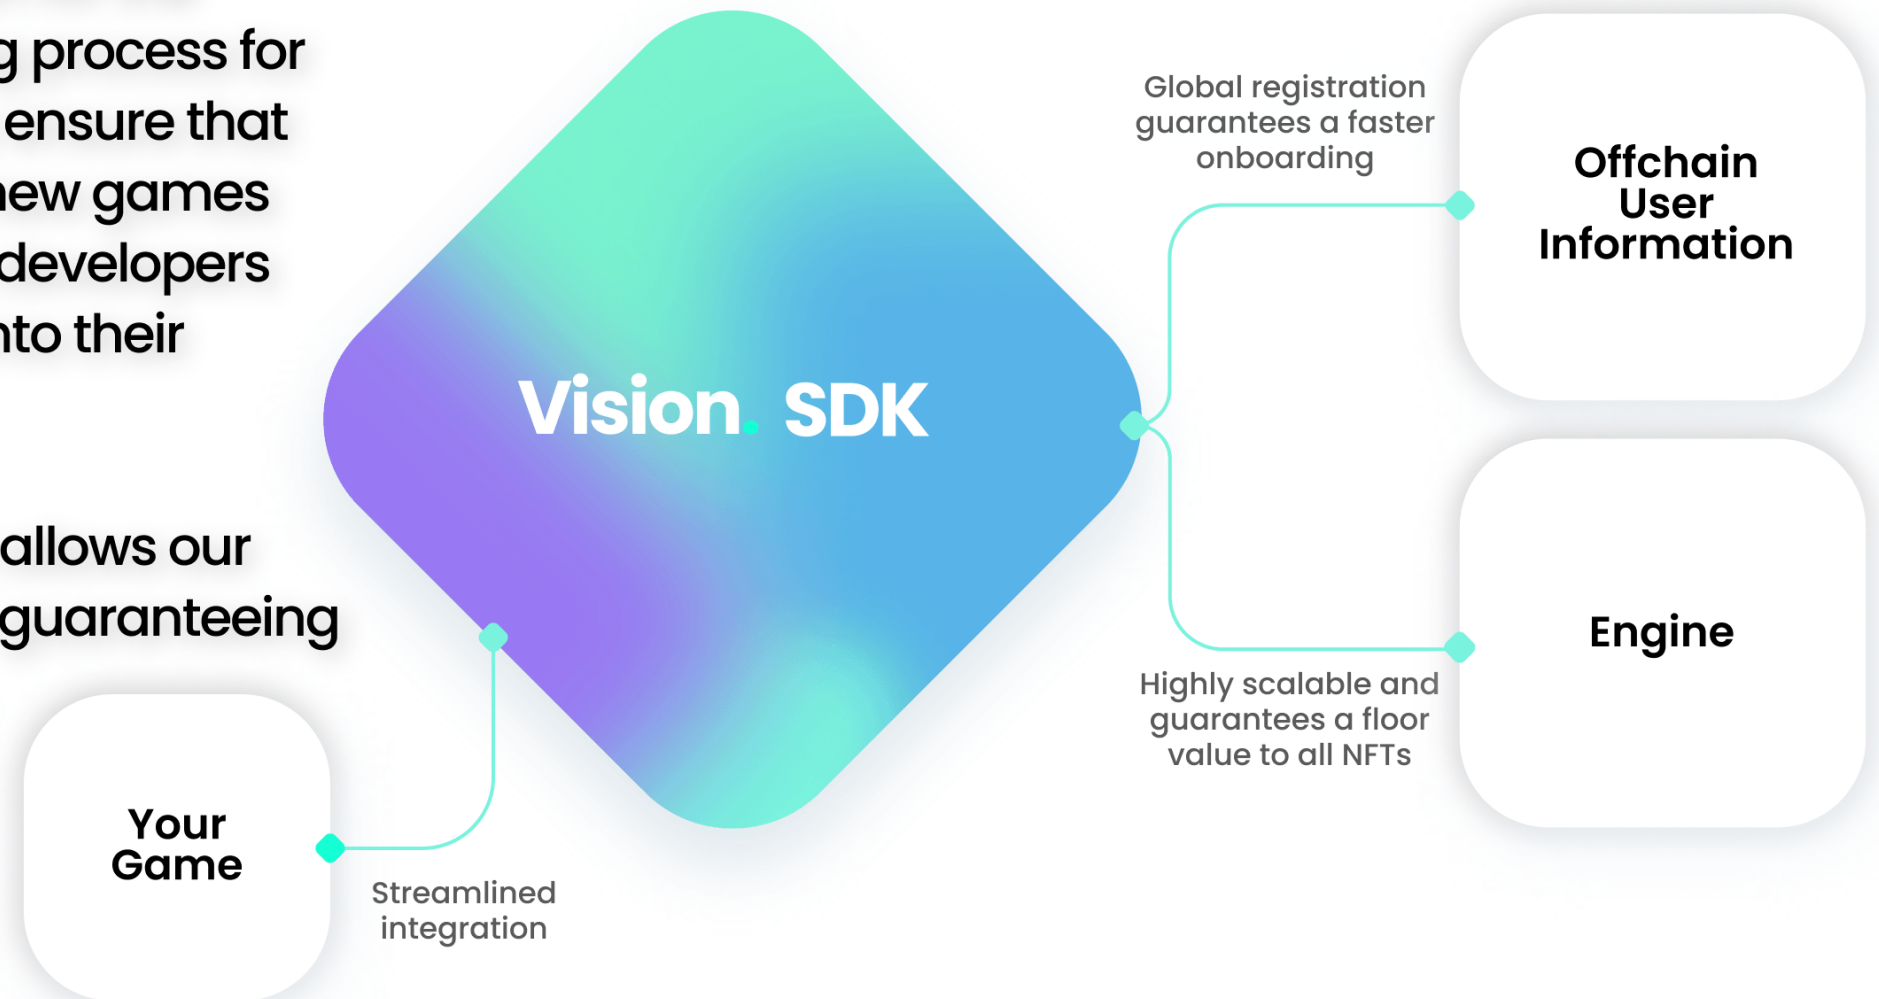

Different Strokes for Different Gamers

Traditional Gamers value the gameplay experience first and foremost. The current onboarding process to start playing Blockchain games has seen terrible conversion rates, and while those gamers are willing to pay for in-game content, the initial investments often required to gather the necessary NFTs are most of the time enough to scare them away.

Blockchain Gamers on the other hand, are already knowledgeable when it comes to setting up wallets, and they don't shy away from investing, recouping their losses as the value of their in-game items increases, or through play-to-earn approaches.

At VisionGame we believe that barriers are meant to be destroyed. Our VisionWallet simplifies onboarding for users, while our single sign-on process ensures that any possible complexity remaining will be only met once.

This ever growing userbase makes up our VisionCommunity, an invaluable asset that allows new products to instantly dip into a pool of ready-to-play Gamers.
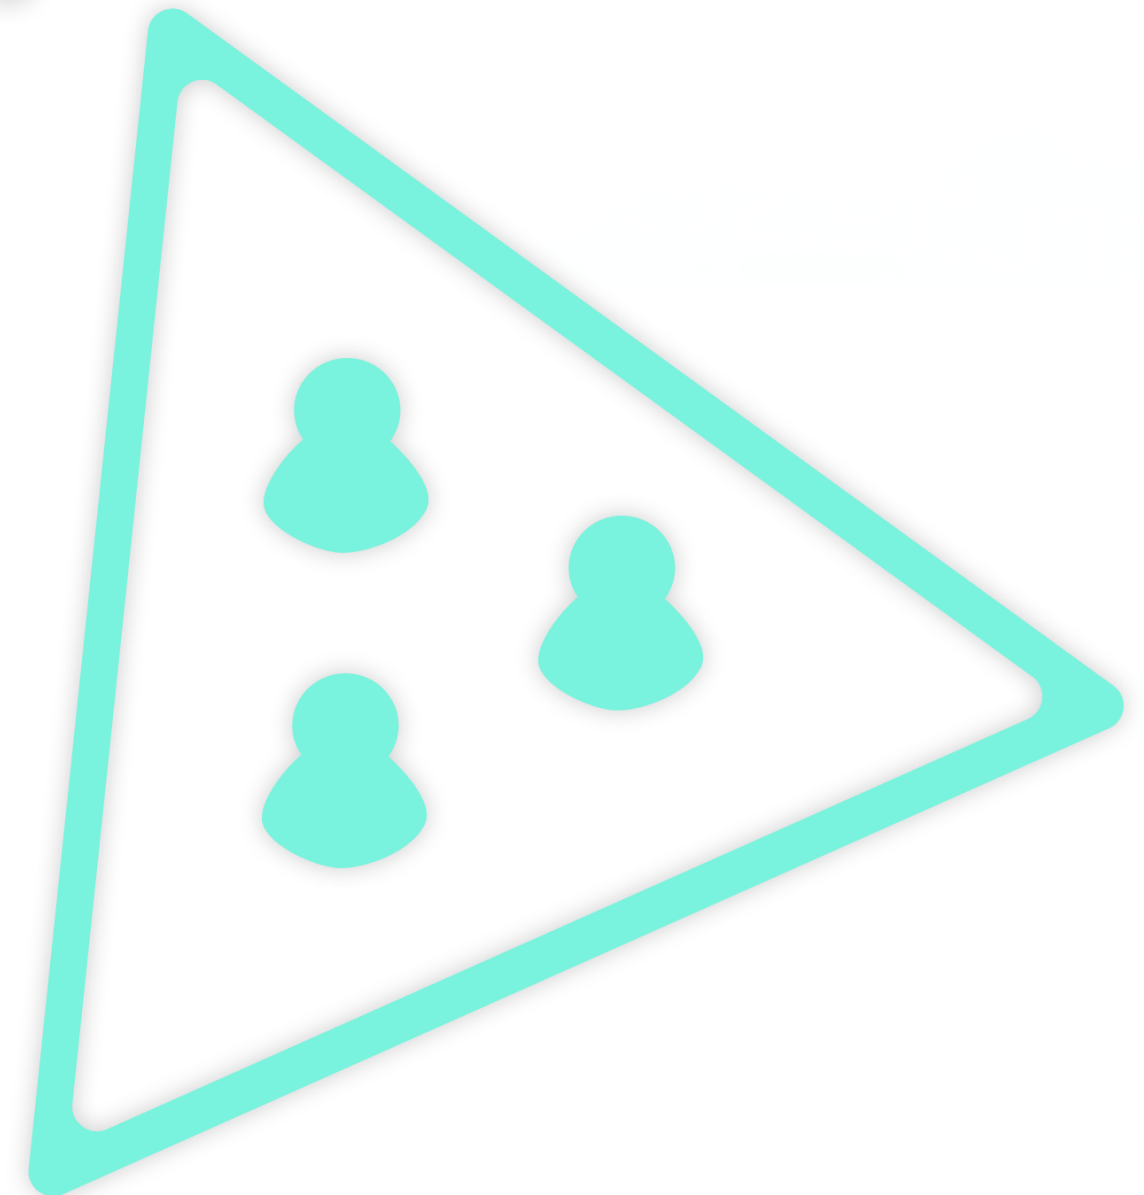

VisionOffering: The Future of Crowdfunding

Current Crowdfunding platforms fail to provide developers with the flexibility they need to raise funds without committing early on to specific in-game rewards and mechanics. Users, on the other hand, are forced to choose blindly which NFTs to support, hoping they will hold their value at least until production ends.

VisionOffering takes away the uncertainty by allowing fans to support projects early on, without committing to particular in-game items. In exchange of Brand Tokens, companies can provide any sort of reward, from physical merchandise to early access, without any limitation.

Our revolutionary Crowdfunding platform combines the benefits of the traditional market to the ones of Initial Game Offerings while minimizing the risks for both companies and gamers, keeping the need to raise funds from disrupting the creative vision.
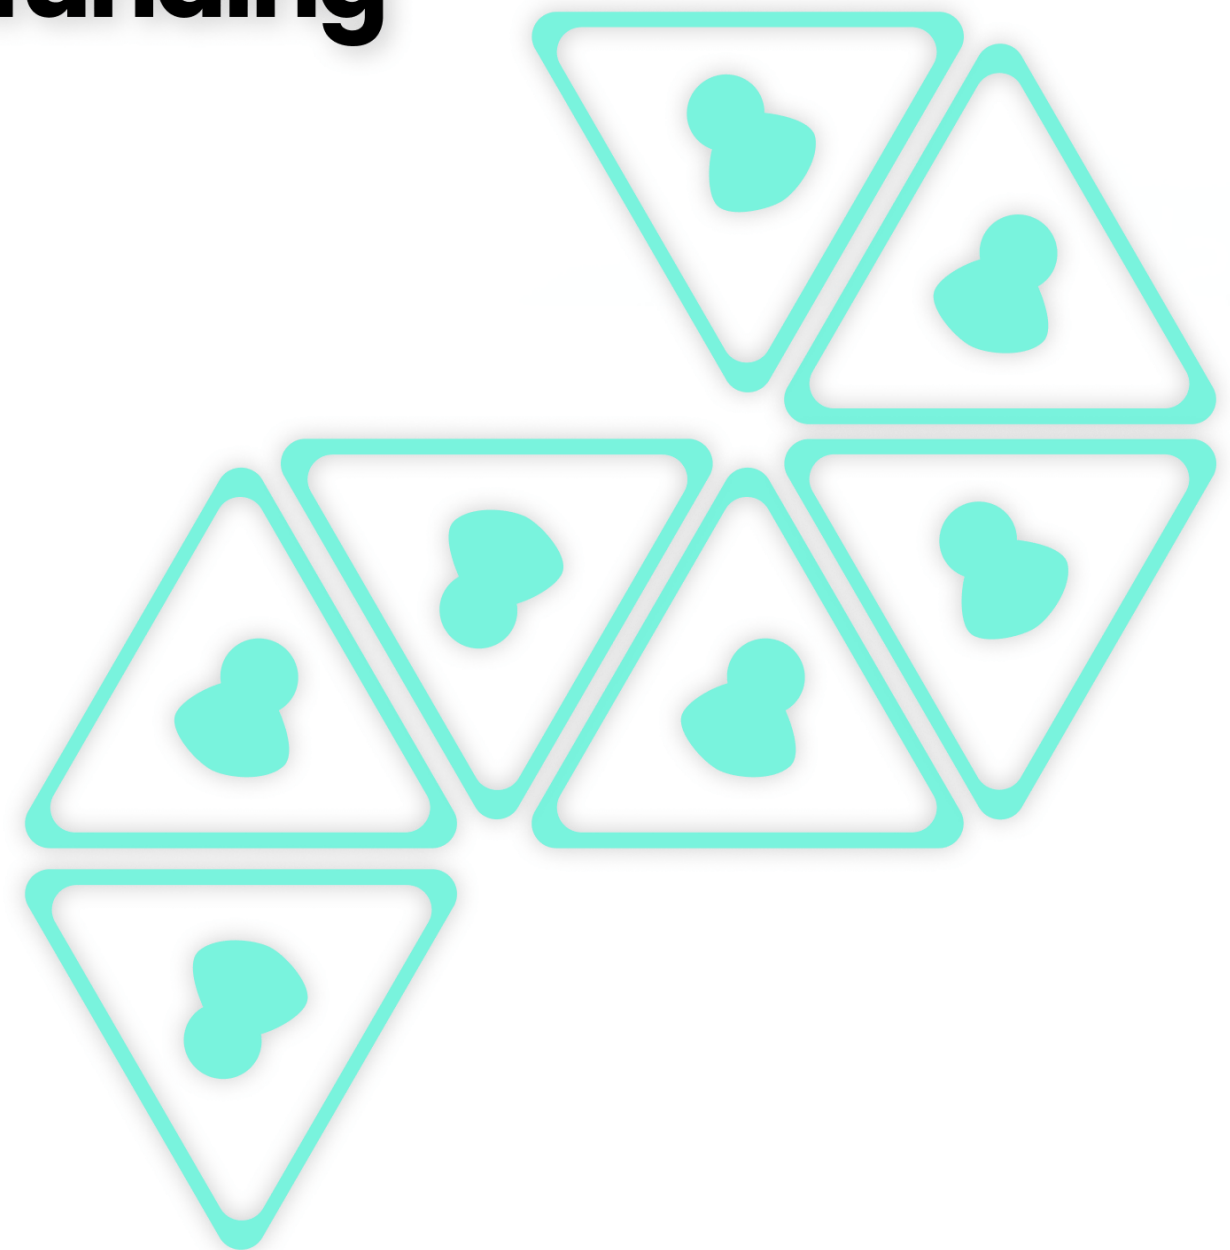

Why Brand Tokens?

- Allows companies to create independent, decentralized economies

- Can be purchased using $VISION, guaranteeing a floor value

- Users have complete ownership of their Brand Tokens, being able to sell or trade them at any time

- No early commitment to doubtful in-game items (NFTs) required

- Companies can provide any sort of reward in exchange, from merchandise to perks for special supporters

- Reward planning can begin later in the development process, without the need of overpromising
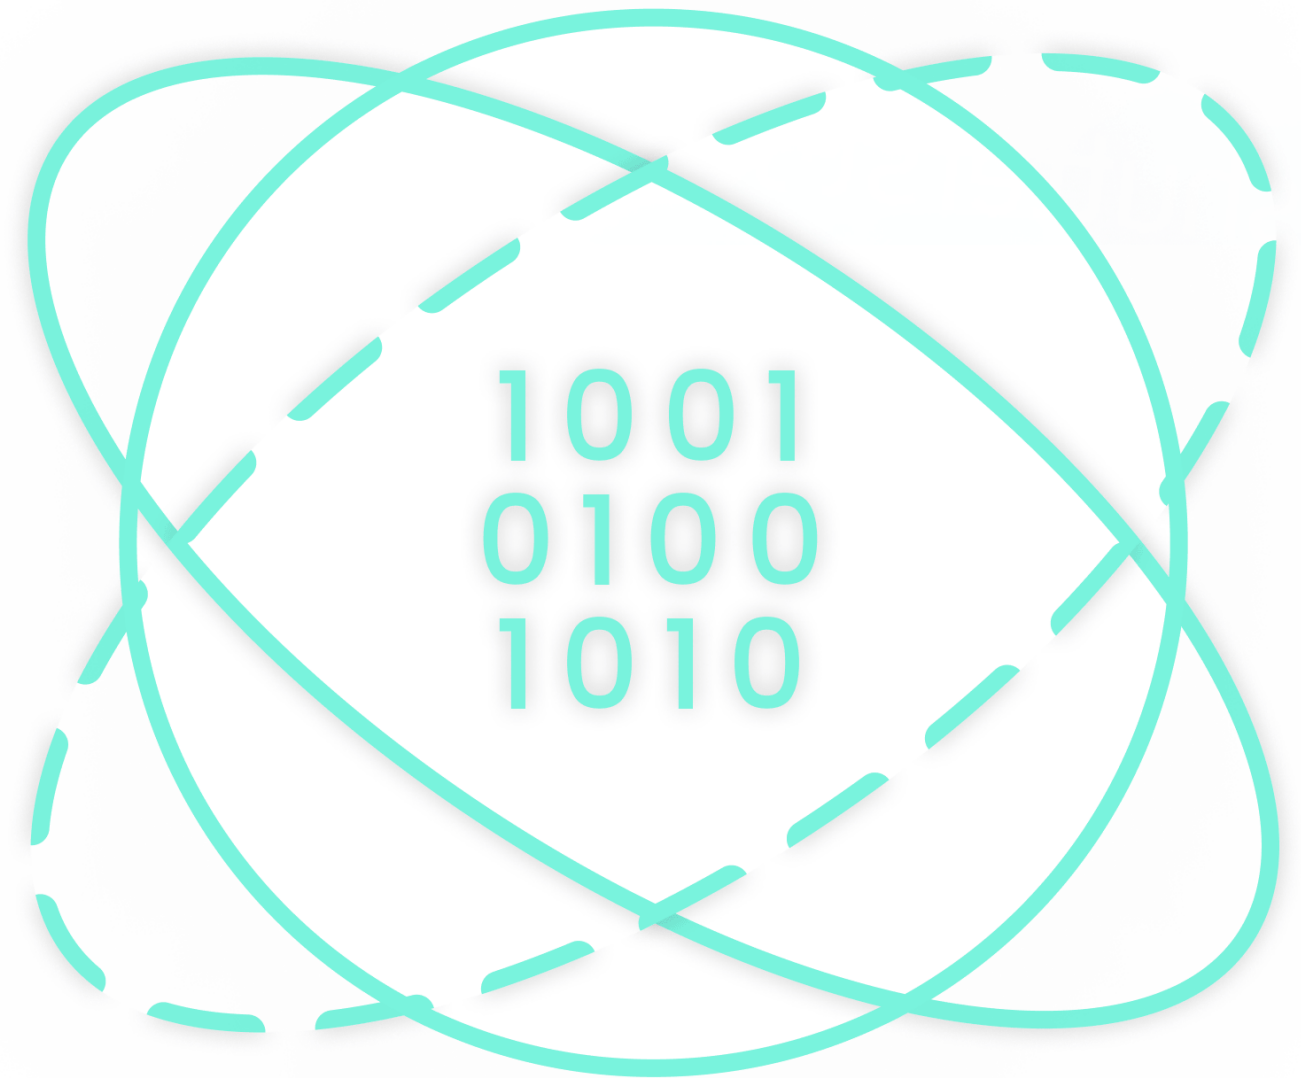

From Concept to Success

The unique approach of VisionOffering

- Product-centric user experience

- Built-in Community tools

- Flexible reward system

- Know-how and expertise at the service of developers

Game development can be harsh. There is no single recipe for cooking the next blockbuster and the amount of expertise and skill sets required can be daunting, especially when it all must come together towards a single, cohesive vision.

VisionOffering ensures that offer meets demand, empowering developers through the support of their fanbase, old and new, but it doesn't stop there. Be it a seasoned company or a startup working towards their dream, our crowdfunding solution takes the same proactive approach in ensuring that the release of the fruit of their labor is a success.

The Vision Ecosystem

Vision.Wallet

Normal game users are comfortable with game points, but not with cryptocurrency. VisionGame will provide a highly secure wallet that does not require difficult onboarding processes.

Vision.SDK

We plan to provide an SDK to allow game developers to implement blockchain technology to games without any prior understanding about the technology, as well as game development specific features.
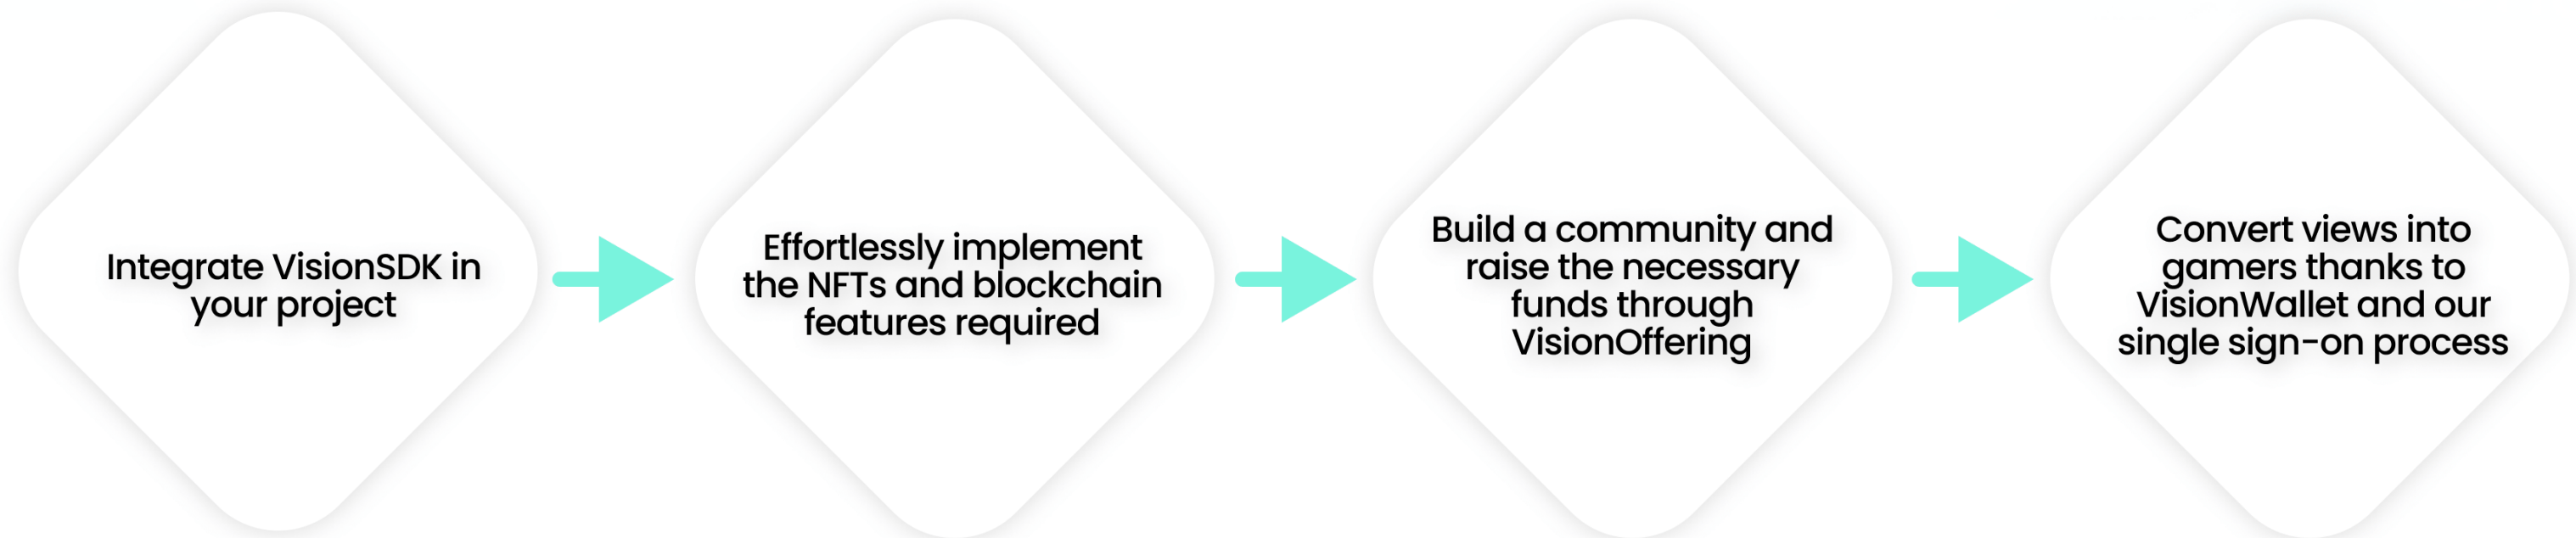

Vision.Offering

The nextgen crowdfunding platform at the core of the Vision experience. Companies can offer a wide variety of rewards to gather funds and early support directly from their audience. Offer and demand have never met so easily
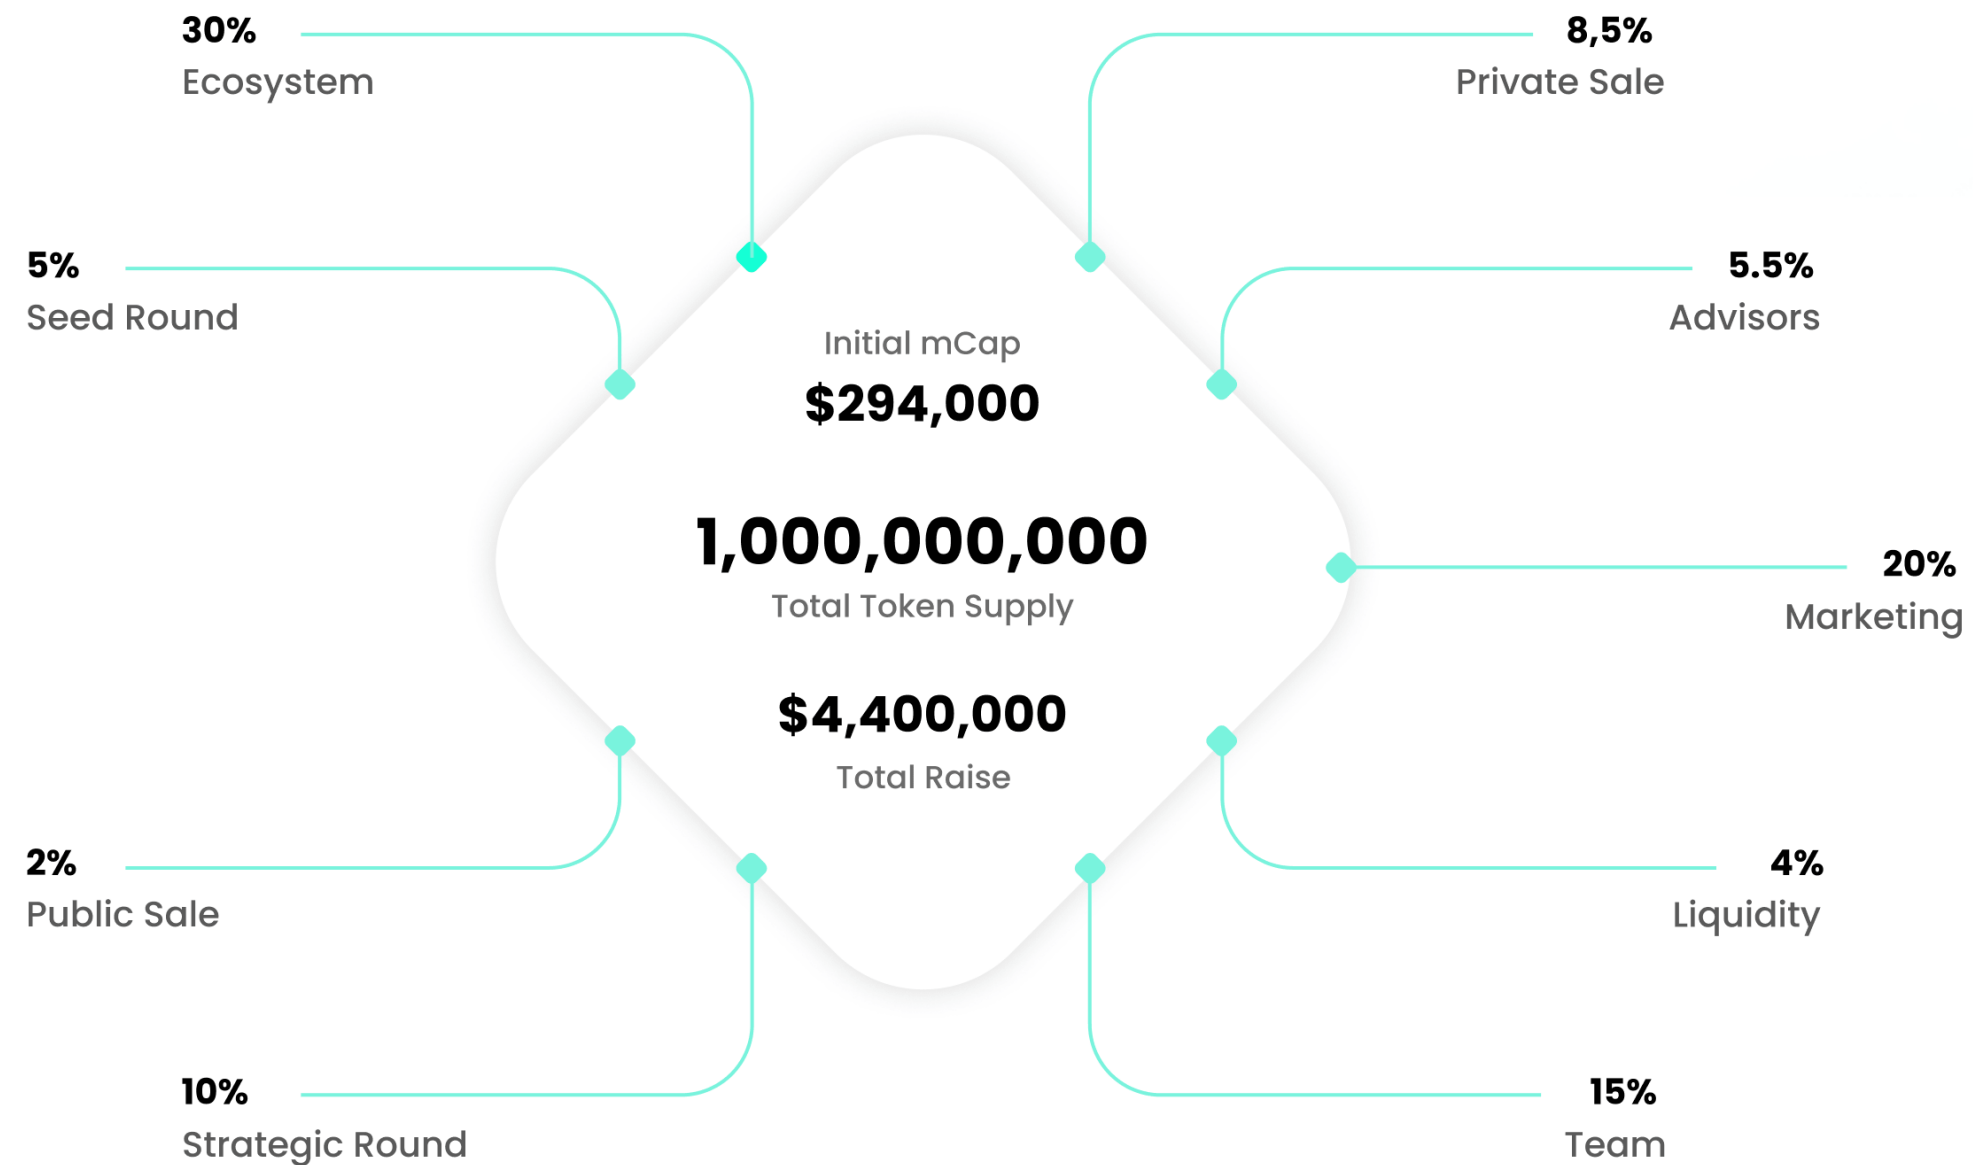

Vision.Community

Users can sign onto any game published with a single user id and password. This will provide new games to gain instant access to an aggregating userbase.

$VISION Utility

The utility of our token is multifaceted, depending on the tool and product being utilized. As each products evolves, introducing new features, the $VISION token stays at the center of the experience, powering and enabling all the necessary aspects of the VisionGame experience.

In VisionSDK, the token is used as fuel for all the necessary gas fees that particular network related features might require. Some features are only accessible by developers that hold the necessary amount of tokens.

With VisionOffering instead, $VISION provides a simple way to obtain Brand Tokens with 0% transaction fees. It also allows users to opt out of their support to a project, by converting their Brand Tokens back to $VISION, without actually affecting the project itself.

As our first party games come to market, $VISION will stll be powering part of the in-game currency propositions.
